

USER GUIDE

Character Preparation

To have a better script performance, there is a series of recommendations in order to prepare the character that you will apply the rig to.

- 1- Izi Rig only reads characters that are in a T-Pose or an A-Pose.
- 2- It is recommended to pose the hand towards the X axis in Maya.
- 3- The position of the feet need to be in a straight position in the Y axis for it to have a correct rotation.

Use of the Tool

With the character ready to rig :

1- Open the Izi Rig Interface.

2- Select the character

This step can be done by selecting the node directly from the outliner or by selecting the geometry from the camera in Maya.

Character selection window

It is highly recommended that the character is only one piece of geometry. Izi Rig automatically will combine the character if it is made from different meshes.

Use of the Tool

Character Selection Window

Use of the Tool

3- Correct character orientation

Use of the Tool

4- Placement of the markers on the joints of the model

Window with instructions, guide of marker placement on character

Marker Sub Menu

Button in case that no hands are needed in the character.

Use of the Tool

If you turned off the hand button skip this step.
5- Marker placement on the hand joints

Correct marker arrangement
